Dashboard Builder — Feature Release

Vercentic Platform · March 2026

Overview

The Dashboard Builder introduces fully configurable, role-aware dashboards across the Vercentic platform. Administrators and authorised users can create multiple named dashboards, populate them with live data panels, and control exactly who can view or edit each one — with all data access governed by the existing RBAC and org-scoping rules.

Key Features

Multiple Dashboards

Create any number of named dashboards per environment. Each has a name, description, colour accent, and icon. One can be marked as **Default** — the first dashboard users see. Dashboards can be **duplicated** with a single click, cloning all panels.

Panel Types

Panel Type	What it Shows
KPI Stat	Single metric with trend % vs previous period. Supports field-level filtering.
Chart	Bar, line, or pie chart grouped by any field value. Configurable max items and filters.
Record List	Live filtered table from any object. Column selection, field filters, sort, row limit.
Activity Feed	Chronological log of record creates, edits, and deletes across the environment.
Saved Report	Embeds a saved report from the Reports module.
Text / Note	Free-text panel with optional background colour. For announcements or guidance.

Panel Configuration

Each panel has a settings editor covering:

- **Size** — column width (1–12 cols) and row height
- **Title** — optional display label
- **Object** — source object (People, Jobs, Talent Pools, or any custom object)
- **Filters** — field + value conditions applied before aggregation
- **Columns** — which fields display in list panels
- **Chart type** — bar, line, or pie
- **Content** — rich text and background colour for text panels

Changes reflect in the canvas **live preview** immediately.

AI Dashboard Builder

Click **AI Suggest** in the builder toolbar and describe what you want in plain language:

> *"Show me open jobs by department, candidate pipeline by status, and recent activity"*

The AI reads your live object and field definitions, creates and configures panels automatically. Each generated panel is fully editable after creation.

Access Control

Every dashboard has independent access settings:

Who can view: Everyone (all authenticated users), By role (one or more selected roles), or Specific users.

Who can edit: Selected roles, plus the creator always retains edit access. Super Admins can view and edit all dashboards.

> ***Important:*** *Dashboard access only controls who sees the dashboard. All data inside panels is still governed by the user's RBAC permissions. Object permissions, field visibility, and org unit scoping are enforced at query time on every panel request.*

How to Use

Creating a Dashboard

1. Go to **Dashboard → My Dashboards** via the top nav dropdown
2. Click **New Dashboard**
3. Enter a name, optional description, and choose a colour
4. Optionally tick **Set as default**
5. Click **Create & Edit** — opens the builder immediately

Building Panels

1. The **left sidebar** lists all available panel types
2. Click any type to add it to the canvas
3. Click a panel to open the **right-hand config editor**
4. Configure object, filters, columns, and size
5. The canvas shows a **live preview** with real data from your environment
6. Use **AI Suggest** to generate multiple configured panels from a plain description

Setting Access

1. Click **Access** in the builder toolbar
2. Choose viewer rule (Everyone / By role / Specific users)
3. Select which roles can edit
4. Changes save immediately

Managing Dashboards

From the **My Dashboards** list:

- **Edit** — open the builder
- **Set default** — make this the landing dashboard
- **Duplicate** — clone with all panels
- **Delete** — removes dashboard and all panels

A **switcher dropdown** appears top-left when multiple dashboards are accessible. Users only see dashboards they have access to.

RBAC & Data Security

The Dashboard Builder enforces security at every layer:

- **Panel data is RBAC-gated server-side** — every panel data request checks the requesting user's role permissions. If the user lacks `view` permission on an object, the panel displays "🔒 No access" rather than any data.

- **Org unit scoping** — users assigned to an org unit only see records within their subtree, applied automatically to all stat, chart, and list panels.

- **Field visibility** — fields hidden by role-level rules are stripped from list panel rows before the response is returned.

- **Dashboard access ≠ data access** — granting view access to a dashboard does not grant any additional record-level permissions. Both systems are independently enforced on every request.

Admin Setup Notes

Default Dashboard

Each environment supports one default dashboard. Setting a new default automatically clears the previous one. If none is set, users see the first accessible dashboard.

Recommended First Dashboards

Dashboard	Audience	Suggested Panels
Recruitment Overview	All recruiters	Open jobs stat, Candidates by status chart, Interviews this week stat, Recent activity feed
Hiring Manager View	HM role	Assigned reqs list, Pipeline stat, Pending scorecards list
Sourcing Dashboard	Recruiters	Candidates by source pie, Time-to-screen trend, Talent pool totals

Use **AI Suggest** with a plain description of each to generate panels automatically.

Technical Reference

Item	Detail
Backend	`server/routes/dashboards.js`
Builder UI	`client/src/DashboardBuilder.jsx`
Viewer UI	`client/src/DashboardViewer.jsx`
Nav path	Dashboard dropdown → My Dashboards
Data	`dashboards` + `dashboard_panels` collections
Auth	`apiClient.js` — `X-User-Id` + `X-Tenant-Slug` on all requests
Charts	Recharts (bar, area/line, pie)
Grid	12-column CSS grid, configurable per panel

API Endpoints

Method	Path	Description
GET	`/api/dashboards`	List accessible dashboards
POST	`/api/dashboards`	Create dashboard
GET	`/api/dashboards/:id`	Get dashboard with panels
PATCH	`/api/dashboards/:id`	Update settings

DELETE	`/api/dashboards/:id`	Soft-delete
POST	`/api/dashboards/:id/duplicate`	Clone dashboard + panels
POST	`/api/dashboards/:id/panels`	Add panel
PATCH	`/api/dashboards/:id/panels/:panelId`	Update panel config
DELETE	`/api/dashboards/:id/panels/:panelId`	Remove panel
GET	`/api/dashboards/:id/panels/:panelId/data`	Fetch live RBAC-gated panel data

Known Limitations (v1.5)

- Panel drag-and-drop repositioning not yet implemented — panels stack in creation order. Resize via the config editor.
- Saved Report panel renders a placeholder; full embedding planned for v1.6.
- AI Suggest requires `ANTHROPIC_API_KEY` to be set on the server.
